Introduction

The Ave hotel management system is not only characterised by a sophisticated design, but also by a high degree of reliability. **Each room can be monitored by the central computer at the reception desk** in real time. Domina Hotel ensures the optimization and control of energy consumption for each individual room, thus achieving significant savings, on a regular basis, throughout the year. **It can be integrated with the home automation system DOMINAplus** (touchscreen, controls and actuators)...

REASONS TO CHOOSE A HOTEL MANAGEMENT SYSTEM

1. To reduce management costs
The automation allows increased efficiency and simplifies the control of the system by bringing huge energy savings of up to 35-40% on light, heating etc.

2. For the safety of the whole structure
The automation system allows very high security standards that can prevent thefts and/or intrusions.

3. To distinguish yourself from the mass
The clients would be impressed by luxury, quality and extreme efficiency and the hotel will acquire added value.

4. To have a system updated with the latest technologies
Nowadays, hotels that want to excel must offer something more to their guests.

5. To have total control of the whole structure
The hotel management system allows the use of a direct user interface that can control all the devices in the facility and supervise the staff/guests of the hotel.

TECHNOLOGY

Ave hotel management systems use the contactless Mifare and 125kHz technology. Access cards made using this technology are completely secure, do not allow unauthorized duplication and are programmed for each user separately, which makes you and your clients completely protected from possible misuse. Thanks to the possibility to integrate the card with an e-money service (not supplied by AVE), you will be able to offer your customers a range of new services using the entry card, which will also be used for payments within the hotel.

EFFICIENCY AND ENERGY SAVING

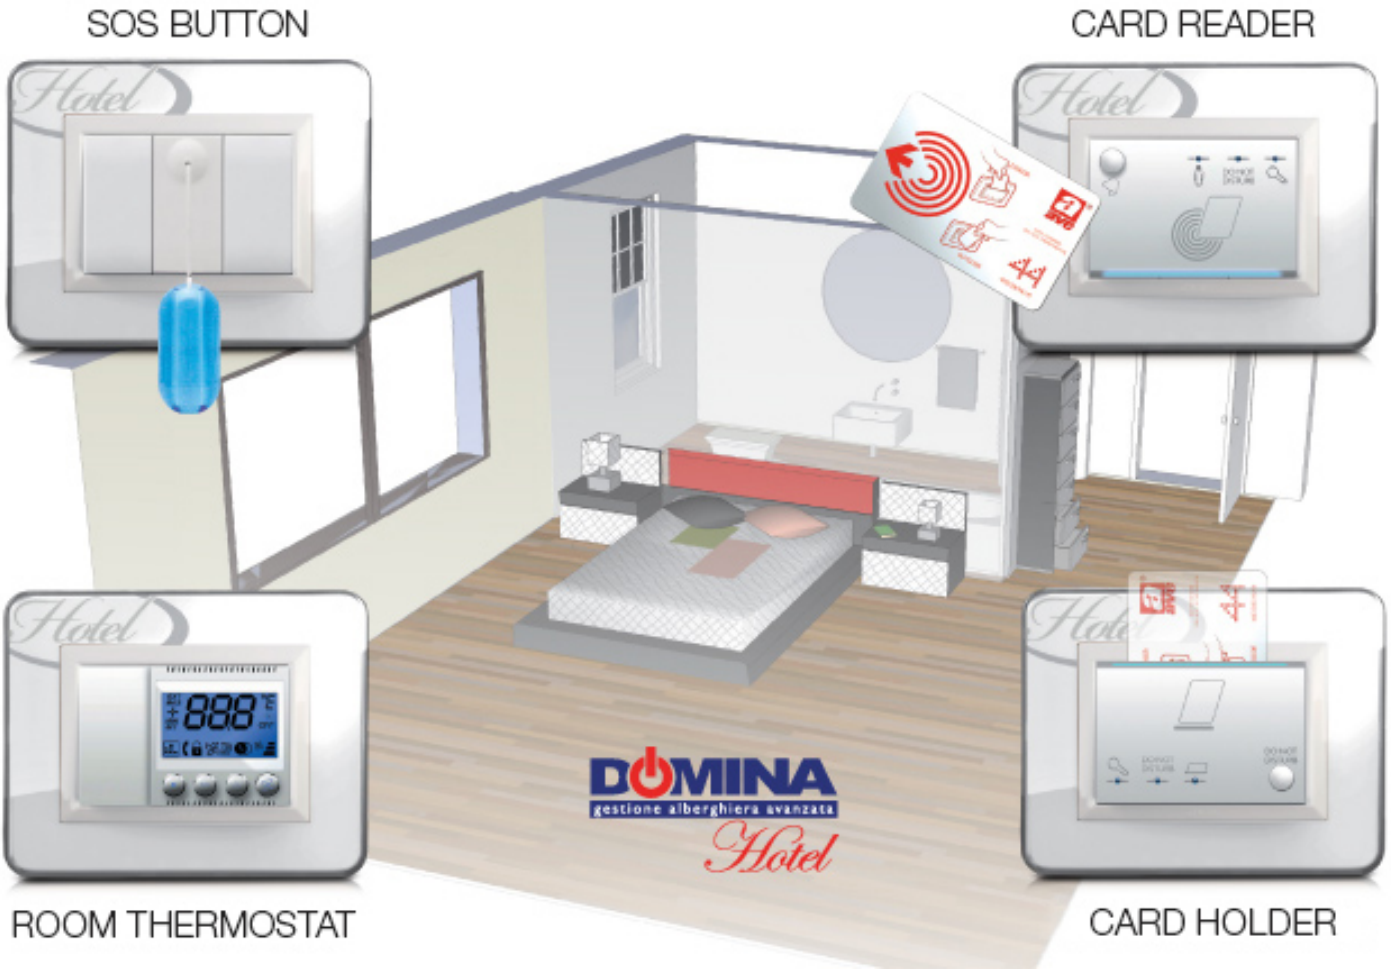
The centralized monitoring from the reception will keep you informed of every event that occurs in the hotel and allow you to act quickly and remedy any shortcomings. In addition, Domina Hotel ensures the optimization and control of energy consumption for each individual room, thus achieving significant savings, on regular basis, throughout the year. The results of use of this system are satisfied users, more efficient operations and reduced operative costs.

INTEGRATION

The Ave Domina Hotel System can be integrated with DOMINAplus home automation (touchscreen, controls and actuators). Furthermore, by using the dedicated software interface, it can be integrated with the “Opera” invoicing system by Micros Fidelio and the centralized VRV/VRF AC system of "Daikin" and "Mitsubishi".

FLEXIBILITY

The Domina Hotel system by AVE can satisfy all your needs in terms of costs, design and performances. The stand-alone system is very convenient for managing small hotels because it is very simple and economical, perfect for environments that do not require solutions that are too sophisticated. The Domina Hotel system can meet the ever increasing requirements with the options offered by the networked system. If an expansion is planned in the future, there is an ideal solution for this as well. With a few updates, the Ave Domina Hotel system adapts to the growing structure without the need to change the existing installations. In this way, you have the opportunity to rationally allocate your investments over time.



ELEGANCE

The front plates of the card reader and other wiring accessories are fully customizable to your requirements. The front plates can be marked with the hotel's logo, room number and any other indications for a further touch of elegance and a personal and incomparable style. The front plates are available in different materials and designs.

COMFORT

The Ave hotel management system is at the customer's disposal to offer maximum comfort during their stay. The room thermostat, which is simple to use and intuitive, enables the customer to precisely control the temperature in the room. The signalling system allows the guest to notify the hotel staff if he/she does not want to be disturbed while in the room. In such a situation, none of the staff members can accidentally ring or enter the room.
