# Burglar detection systems

Burglar detection systems constitute a very important segment in the Ave production program. These are solutions for small and medium-sized buildings of various types (residential, commercial, industrial, catering and the like). In this segment, Ave has opted for classic anti-burglary solutions that would satisfy the demands of the vast majority of users, provide reliable operation without false alarms and thus increase the security of facilities and people in them.

Capabilities of the Ave anti-intrusion system - solution with expandable central unit AF998EXP

Depending on the size, the assessment of the security risk and the architecture of the protected facility, an appropriate central anti-intrusion unit is selected to be the base of the entire system. Ave offers signalling central units with a capacity of 4 to 32 zones, in wired, wireless or combined designs. All central units have the possibility of the automatic signalling of the alarm over the telephone to the end user or to companies that provide 24-hour surveillance and physical and technical security of the facilities. As an additional option, there is GSM alarm signalling on the mobile phone of the user.

Some of the central units can be integrated with the Ave smart house system, which further increases the level of security and allows the visualization of the anti-intrusion system on the Touchscreen, thus simplifying the control for the end-user.

In addition to the aforementioned central equipment, as part of the Ave anti-intrusion system, all the necessary peripheral equipment is also available:

- passive infrared presence detectors
- dual infrared/microwave presence detectors
- magnetic contact for various purposes (wall-mounted, flush-mounted, for armoured doors, etc.)
- infrared barriers for doors and windows
- encrypted contact and contactless tags for activating/deactivating the system
- light and sound alarm signalization, etc.
